Feed Safety

Wenger Feeds' customers understand the critical role livestock feed has in the production of safe meat and eggs for human consumption. In addition, company customers expect that their feed will be manufactured to the highest industry standards for feed quality and safety. As one of the only feed mills in North America to earn triple ISO certification, Wenger Feeds offers its customers a consistent, safe, tested, and traceable source of feed.

All ingredient suppliers must be approved prior to delivering any ingredient to any company mill. Corn is tested prior to receiving. Other ingredients are regularly sampled for quality. Bagged and bulk ingredients are rotated regularly and stored in designated storage areas. All company mills have rodent control programs in place to insure the integrity of ingredients and finished products.

ISO-certified processes are in place for every stage of the manufacturing process, and outgoing loads can be traced back through the manufacturing process. In addition, all finished feeds are sampled, and a retain sample is stored for up to six weeks should a concern arise on the farm.

Finally, Wenger Feeds follows all best management practices for biosecurity. Trucks delivering feed use onboard disinfecting units to spray the tires of the truck when entering and exiting a farm. To avoid contamination, feed is never returned to a mill once it has been delivered to a farm.
